11 Conclusion 11

STATUS

Live on Robinhood Chain (chain id 4663). Cases are staked in the chain's dollar, USDG, or in the token PRECRIME. Every protocol figure here is read from the contracts or the running services; section 1's market figures are dated measurements.

Abstract

Memecoin misconduct is fast, common and impossible to price. A developer sells their supply within a minute of launch; a pool's liquidity is pulled; the wallets that sniped a launch exit together. Traders hold strong beliefs about which tokens are next, but cannot hedge them, be paid for being right, or prove they called it.

preCrime is a non-custodial, parimutuel prediction market on what public wallets and tokens do next, on Robinhood Chain and, judged from Solana's own history, on pump.fun coins and Solana prices. Anyone opens a **case**: a precise rule about an observable on-chain event before a deadline. Others stake **GUILTY** or **INNOCENT** in USDG or PRECRIME. An automated resolver reads the outcome from finalized chain data, and a second, independent machine must confirm the verdict on chain before anyone is paid; crypto and dollar price cases settle from Chainlink rounds the contract checks itself. A verdict nobody confirms refunds everyone.

No person can pick a side that no machine reached. A case's terms are fixed when it opens, every pool is capped, every fee lands in a contract or wallet anyone can read, and every protocol change waits 48 hours in public, where a second proposer can cancel it.

01 The problem

Misconduct is the market's base rate. In samples taken on Robinhood Chain on 25 September 2026, the deployers of 35% of 1,666 launches on Pons, the chain's leading launchpad, sold 90% or more of what they had bought, with the median first sale **within a minute** of launch. In one day of new Uniswap pairs, 300 of the 312 seeded with WETH or USDG (96%) lost at least half their liquidity, a median of 10 minutes after creation.

Beliefs about misconduct have no market. On 6 October 2026, Polymarket had no open market on a developer sale or a liquidity pull, and Kalshi's crypto series had none.

The hard part is the verdict. Most prediction markets answer "did it happen?" with a person, a committee or the market's creator. For on-chain conduct that is unnecessary: the evidence is public, permanent and machine-readable. It needs only a rule precise enough for a machine to judge, and a settlement in which nobody, preCrime included, can pay a side no machine reached.

02

How a case works

1 **Open a case.** Post a PRECRIME bond, pick a wallet, token or pool, and say what it will do: "this dev wallet sells at least half of what it holds when staking closes, within 24 hours", "this pool loses 80% of its liquidity", "BTC touches a target". The rule is fixed and published before anyone stakes.

2 **Take a side.** Stake GUILTY (it happens) or INNOCENT (it doesn't), in USDG or PRECRIME; a price case reads YES or NO. Staking closes before the counting window opens, so nobody can stake after watching the event. On USDG cases that offer it, a stake of $1 or more goes by signature: the staker signs one USDG transfer, preCrime's relayer sends it and pays the gas, and the pool credits it only to the signer. No ETH and no approval are needed.

3 **The chain settles it.** Winners split the pool. If no verdict is confirmed, or nobody took the other side, everyone is refunded.

2.1 A rule committed on chain

Every case is a machine-readable rule: one observable event, a threshold, a counting window and a deadline. The pool is created with the hash of its canonical form, so anyone can confirm it settles against exactly the rule they were shown. Before a wallet signs a stake, claim or refund, the page reads the pool on chain and refuses unless preCrime's factory made it and its rule hash matches.

2.2 Case types

These case types are open, each settled from chain data alone:

CASE TYPE	THE QUESTION IT ASKS
Dev dump	Will this wallet sell a large share of what it holds?
Sniper dump	Will the wallets that sniped this launch sell down?
Bundler exodus	Will this group of wallets collectively sell down?
Liquidity heist	Will this pool lose a large share of its liquidity?
Liquidity rush	Will this pool gain a large share of liquidity?
Supply teleport	Will this wallet move a large share of total supply somewhere new?
Stealth mint	Will new supply of this token be minted?
Ownership renounced	Will this contract's owner renounce it?
Whale accumulation	Will this wallet buy a large share of the supply?
Pons graduation	Will this Pons launch graduate from its bonding curve?

CASE TYPE	THE QUESTION IT ASKS
Price threshold	Will this token's time-weighted price cross a set level?
Price move	Will BTC, ETH or another listed asset reach a target? Will a dollar coin depeg?
Stock Token move	Will this Robinhood Stock Token move by a set percentage?

The case wizard refuses any case that nothing can measure.

Judged on Solana. Cases on pump.fun coins (dev dumps, supply moves, sniper exits, whale buys and graduations; dev dumps also on any Solana mint) and price moves on Solana feeds from Chainlink and Pyth are staked in USDG on Robinhood Chain and judged from Solana's history by the same two machines (section 4.1).

2.3 Pace

A **standard** case runs for hours or days. A **lightning** case closes staking after 15 minutes and counts for 15 or 30 minutes; on a 15-minute count a winner is paid about an hour and a half after staking closes. Lightning is offered where a short window means something, never on a case judged from Solana.

03 Settlement

3.1 Parimutuel pools

Each case has its own pool contract. On settlement the winning side splits the whole pool pro rata by stake, after a fee of **2% of the gross pool**, the most a pool can charge. Stakers set the odds; the stake screen shows the implied payout before anyone signs. The fee and its five shares are written into each pool when it opens, so a later change reaches only future cases; the splitter's onward split is the timelock's to set.

SHARE OF THE POOL	SHARE	IN A PRECRIME POOL	IN A USDG POOL
Winning side	98%	split pro rata by stake	split pro rata by stake
Treasury	0.95%	the timelocked treasury	the pool-fee splitter: 44.75% PRECRIME stakers, 44.75% company, 10.5% backers
Case creator	0.35%	the creator, claimed after settlement	the creator, in USDG
Burn / jar	0.30%	**burned**	the jar (section 6.3)
Evidence reserve	0.20%	a second timelocked treasury	the same reserve

SHARE OF THE POOL	SHARE	IN A PRECRIME POOL	IN A USDG POOL
Referral	0.20%	the staker's referrer, else treasury	the staker's referrer, else the splitter

The evidence reserve pays for resolution quality, reviews and data. A winner who held an access lock (section 6.2) when they staked pays 1.75% instead of 2% within the lock's cap, the 0.25% rebated from the treasury's share.

3.2 Voids and refunds

A case refunds every stake in full, with no fee, when:

- nobody took the other side before staking closed;
- the rule cannot be measured;
- no verdict is confirmed within 24 hours of when claims would have opened;
- a review rules a refund, or nobody rules it within 3 days;
- the resolution deadline passes without a verdict; or
- a price case's Chainlink proof voids it (section 4.3).

Silence never pays a side. It only refunds.

Claims sent for you. Anyone may send a staker's claim or refund, and it pays only that staker. On cases that offer it, preCrime's relayer sends a signed-in account's claim to its own verified wallet and pays the gas.

Proven arithmetic. The settlement arithmetic is formally proven in Bend, over a model tied to the contract, for every input: a settlement adds up to the pool to the last unit, rounding never overdraws it, and silence only ever refunds.

04 Verdicts without trust

4.1 Two machines

For every case except crypto and dollar price cases on Robinhood Chain's Chainlink feeds:

1. **The resolver posts.** After the counting window, an automated resolver evaluates the rule from finalized chain state and posts its verdict on chain.

2 **The verifier confirms.** A second machine, the watchdog, with its own host, key and provider, re-runs the evaluation and confirms on chain only if it reproduces the verdict exactly; if its result differs, it disputes, which opens a review.

3 **Claims open** once the escalation window (at least an hour) has passed and the verifier has confirmed. If it never confirms, anyone can trigger a full refund 24 hours after claims would have opened.

Only a seated resolver can post and only a seated verifier can confirm; seating either takes a public 48-hour timelock proposal.

4.2 The one human lever

A person enters only when the operator escalates a case before it pays (publishing the reason on chain) or the two machines disagree. The contract then bounds the ruling: nobody can choose a side no machine reached, or flip a verdict both machines agreed on. A review nobody rules refunds after 3 days. Anyone signed in can report a provisional verdict as wrong from its case page.

4.3 Price cases settle by Chainlink proof

Crypto and dollar price cases on Robinhood Chain's own Chainlink feeds skip the resolver. A settler contract bound to the pool at creation holds their terms; its rules are set in the contract, and changeable only by a public 48-hour timelock proposal. Anyone can submit the Chainlink rounds that prove the outcome; the contract checks the proof itself. A case on whether the price touches a level voids if the level was already reached when staking closed, or if the feed changes, fails or goes stale before a crossing is proven; with no crossing proven, it settles NO. Nine feeds qualify: BTC, ETH, LINK, ENA, WBTC, cbBTC, LBTC, USDC and USDT.

05 Risk and governance

5.1 Ceilings

- A pool opened by a new creator holds at most **25,000 USDG** or **2 million PRECRIME**; creators the timelock moves up for their track record may open pools of 2× and 4× that.
- All open pools together hold at most **1,000,000 USDG** and **40 million PRECRIME**.

Raising a bound takes a public 48-hour timelock proposal.

5.2 Changes and the operator

Every protocol change goes through a public 48-hour timelock proposal that a second proposer can cancel. A case's rule, fee, ceiling and deadlines are fixed when it opens. The operator can pause new cases, new stakes and vault deposits, and send a verdict to review before it pays; it cannot take or redirect anyone's funds, or change code.

The contracts are upgradeable only through that timelock; no key upgrades at once. Every pending upgrade is published on chain in an upgrade notice. While an upgrade that reaches the case pools waits out its 48 hours, preCrime's relayer pays out what ended cases already owe. While a notice is active, the staking vault stays open, and shares held from before the notice leave without the instant-exit fee.

06 The PRECRIME token

6.1 Supply

The total supply is **1,000,000,000 PRECRIME**.

ALLOCATION	AMOUNT	SCHEDULE
Community rewards	350m (35%)	evenly over 48 months; paid only through seasons and capped events
Locked liquidity	200m (20%)	held by the liquidity locker (section 6.4)
Treasury	200m (20%)	nothing for 12 months, then 25%, the rest continuously to month 48, to the treasury
Team	150m (15%)	nothing for 12 months, then 25%, the rest continuously to month 48
Ecosystem	75m (7.5%)	continuously over 24 months: grants, integrations, incentives and the emission
Public distribution	24.75m	liquid, in the founder's wallet
First-bond grants	0.25m	1,000 each to the first 250 creators; the rest burned after a year

Every schedule except the public distribution is enforced by its contract.

6.2 What PRECRIME does

- **Case bonds.** A creator posts a PRECRIME bond before the case exists: 1,000 for a new creator, 250 or 100 for creators the timelock moves up for their track record, who may also run more cases at once. A clean case returns the bond; a slashed bond is half burned, half paid as a bounty.

- **A stake asset.** Cases can be staked in PRECRIME as well as USDG.
- **Access locks.** Locking 5,000, 25,000, 100,000 or 500,000 PRECRIME for 30 to 365 days opens the product and API tiers without a subscription and earns the 0.25% fee rebate (section 3.1) on stakes placed while locked, up to a cap per rung. A lock returns exactly what was locked.
- **Staking (sPRECRIME).** Stakers earn dollars, streamed: 44.75% of every USDG pool's treasury share and 5-10% of every sponsor and API sale. They earn PRECRIME through the share price, from the weekly emission and from exits: leaving takes a 14-day cooldown and a 3-day window, or costs 5% at once, which stays with those who stay. The vault holds at most 50 million PRECRIME. Stakers are first in line for losses: if a case pool or the referral distributor falls short, the timelock can move up to 30% of the vault per incident (at most half in 30 days) to a claims contract that pays harmed users by proof, and freeze exits for up to 30 days while it assesses. A disputed verdict or the PRECRIME price is never a claim. The vault's rules are set in the contract, and changeable only by a public 48-hour timelock proposal.
- **Liquidity rewards.** An LP gauge streams 40% of the weekly emission to PRECRIME/USDG liquidity providers, boosted up to 2.5× for those who also stake.

6.3 Burns and the jar

The rest of holders' dollar revenue (a USDG pool's 0.30% burn share, half of the locked liquidity's trading fees, and 15-20% of every sponsor and API sale) collects in the **jar**. The jar has one exit, set by the timelock: anyone who burns 10,000 PRECRIME takes what has unlocked, each inflow unlocking evenly over a day. The company's keeper releases it every hour: it buys the 10,000 PRECRIME on the market, and spends everything the release pays above a small float buying more PRECRIME for the jar to burn.

6.4 Liquidity and the emission

The liquidity locker holds 200 million PRECRIME for Uniswap ranges, and no function can withdraw it. The ecosystem allocation pays up to 500,000 PRECRIME a week for twelve weeks, 60% to the staking vault and 40% to the LP gauge; no yield rate is published, and the site shows what was actually streamed, dripped and burned.

PRECRIME is `0xE57C15CE09B547102aDE4454c0F3AF9AB4e00E9A` on Robinhood Chain; every preCrime contract, with its verified source, is listed at precrime.xyz/transparency.

07

Revenue

preCrime earns from four on-chain sources, each split by a contract and read from the chain on the site's transparency page.

SOURCE	WHAT IS PAID	WHERE IT GOES
Case fees	2% of every settled pool	as in section 3.1
Sponsor placements	labelled slots on case pages, case files and the daily briefing	60% company, 20% jar, 10% stakers, 10% the buyer's referrer
API plans	Explorer free (50 requests a day); Builder $49 for 30 days	65% company, 15% jar, 5% stakers, 15% a first plan's referrer
Locked liquidity	the position's trading fees	dollar fees half the jar, half the company; PRECRIME fees burned

A sale's referral share with no referrer goes to the company. Sponsored placements are always labelled and approved first, and never touch a case, a verdict, the evidence or the organic order. Pro, sold for Telegram Stars in the bot, is off-chain company revenue, reported separately.

08

The backer vault

The **backer vault** keeps lopsided dollar cases from voiding: depositors put in USDG, and the vault stakes the thinner side, never past even, so the case settles two-sided. It backs only a case whose thick side comes from independent accounts, none of them the creator or the measured wallet, and never a lightning case or one on a pump.fun coin or other Solana mint. Backers earn the splitter's 10.5% (about 0.10% of every dollar pool) and win or lose with the sides they back. The vault holds at most $50,000; one pool takes at most 5% of it, and all open pools at most half. Deposits and withdrawals settle weekly at an exact price.

09

The product

The web app at precrime.xyz: case pages with evidence and reports; the Open a Case wizard, which finds a token by ticker, name, address or link and recommends a case; red flags, each one tap from the case it suggests; New launches, a live feed filtered by real trading, a dev still holding 1% or more, and an open case; staking, claims, the

vaults, access locks and the jar; points, rewards, leaderboards and Most Wanted; and a transparency page that sources every figure.

The Telegram bot, @getpreCrimebot: paste a GMGN, Pons, Fomo, pump.fun or other Solana link, or `/find` a ticker, to see the cases it can open; stake through buttons that open your own wallet app; alerts, lightning reminders, a daily briefing, and group installs that post new cases.

For builders and launchpads: an embeddable widget of a token's cases, a public API, signed webhooks, and a launch kit for callers.

Non-custodial. Stakes sit in each case's own contract, every stake is signed in the user's own wallet, every claim pays only the account it is for, and neither the site nor the bot holds funds.

10 Community and distribution

- **Community rewards.** The 350 million community allocation leaves only through points seasons, each published 48 hours before claims open with a list anyone can recompute from the chain, and events such as competitions and bounties, capped at 500,000 each and 2 million in any 30 days. Genesis, the first season, runs 21 October to 2 December 2026; qualifying participants share it by activity.
- **Referrals.** 0.20% of each stake in a settled pool goes to the staker's referrer.

11 Conclusion

Every memecoin buy is already a bet on misconduct. preCrime makes that bet explicit, fair and settled by the chain: a precise rule, two sides, two machines that must agree or a Chainlink proof, and no human hand that can pick a side no machine reached.
